**Sika® MonoTop® 615**

One-component, polymer-modified, silica fume enhanced, lightweight, non-sag mortar

| Description | Sika® MonoTop® 615 is a one-component, polymer-modified, silica fume enhanced, cementitious, non-sag mortar. It is a multi-purpose mortar which can be applied by trowel or low pressure wet spray process. |
| Where to Use | - On buildings, facades, and balconies.  
- On grade, above, and below grade on concrete and mortar.  
- On vertical, overhead, and horizontal surfaces.  
- As a general purpose repair mortar for use on concrete structures in a mild or moderate service environment. |
| Advantages | - One component, factory controlled for consistent quality.  
- To be mixed with potable water only.  
- Excellent workability.  
- Adjustable consistency.  
- Excellent thixotropic behavior, especially suitable for overhead and vertical application.  
- Good mechanical strengths.  
- High bond strength ensures excellent adhesion.  
- Increased freeze/thaw durability and resistance to deicing salts.  
- Compatible modulus of elasticity to concrete generally used for building/facade construction.  
- Compatible with coefficient of thermal expansion of concrete - Passes ASTM C-884 (modified).  
- Application by hand or low pressure wet spray method.  
- Not a vapor barrier.  
- Not flammable |
| Coverage | 0.55 cu. ft./bag. |
| Packaging | 50 lb. multi-wall bag. |

**Typical Data (Material and curing conditions @ 73°F (23°C) and 50% R.H.)**

RESULTS MAY DIFFER BASED UPON STATISTICAL VARIATIONS DEPENDING UPON MIXING METHODS AND EQUIPMENT, TEMPERATURE, APPLICATION METHODS, TEST METHODS, ACTUAL SITE CONDITIONS AND CURING CONDITIONS.

*Prior to each use of any Sika product, the user must always read and follow the warnings and instructions on the product’s most current product data sheet, product label and safety data sheet which are available online at http://usa.sika.com/ or by calling Sika’s technical service department at 800.933.7452. Nothing contained in any Sika material relieves the user of the obligation to read and follow the warnings and instructions for each Sika product as set forth in the current product data sheet, product label and safety data sheet prior to product use.*
### How to Use

#### Substrate

Concrete, mortar, and masonry products.

#### Surface Preparation

**Concrete / Mortar:** Remove all deteriorated concrete, dirt, oil, grease, and all bond-inhibiting materials from surface. Ensure repair area is not less than 1/8 in. in depth. Preparation work should be done by high-pressure water blast (over 20,000 psi), scabbling, or other appropriate mechanical means to obtain an exposed aggregate surface with a minimum surface profile of ± 1/16 in. (CSP-5). Saturate surface with clean water. Substrate should be saturated surface dry (SSD) with no standing water during application.

**Reinforcing Steel:** Steel reinforcement should be thoroughly prepared by mechanical cleaning to remove all traces of rust. Where corrosion has occurred due to the presence of chlorides, the steel should be high pressure washed with clean water after mechanical cleaning. For priming of reinforcing steel use Sika® Armatec® 110 EpoCem (consult Product Data Sheet).

### Priming

**Concrete Substrate:** Prime the prepared substrate with a brush or sprayed applied coat of Sika® Armatec® 110 EpoCem (consult Technical Data Sheet). Alternately, a scrub coat of Sika® MonoTop® 615 can be applied prior to placement of the mortar. The repair mortar has to be applied into the wet scrub coat before it dries.

### Mixing

Pour water in the proper proportion (3.5 qts. ±0.25 qts. per bag) into the mixing container. Add powder while mixing continuously. Mix mechanically with a low-speed drill (400-600 rpm) and mixing paddle or mortar mixer. Mix to uniform consistency, minimum 3 minutes. Manual mixing can be tolerated only for less than a full bag. Do not overwater! Use only amount of water necessary to achieve uniform consistency.

### Application

Sika® MonoTop® 615 can be applied either by hand or wet spray process equipment. Mortar must be scrubbed into the substrate, filling all pores and voids; or the use of a bonding agent (Sika® Armatec® 110) is recommended. Force Sika® MonoTop® 615 against edge of repair, working toward the center.

After filling repair, consolidate, then screed. Material may be applied in multiple lifts. The thickness of each lift, not to be less than 1/8 in. minimum or more than 2 in. maximum, may vary depending on the conditions of the repair area. Where multiple lifts are required, score top surface of each lift to produce a roughened surface for next lift. Allow preceding lift to set before applying fresh material. Saturate surface of the lift with clean water. Scrub fresh mortar into preceding lift. Allow mortar to set to desired stiffness, then finish with wood or sponge float for a smooth surface, or texture as required.

### Tooling & Finishing

As per ACI recommendations for Portland cement concrete, curing is required. Moist cure with wet burlap and polyethylene, a fine mist of water or a water based* compatible curing compound. Curing compounds adversely affect the adhesion of following layers of mortar, leveling mortar or protective coatings. Moist curing should commence immediately after finishing. Protect newly applied material from direct sunlight, wind, rain and frost.

*Pretesting of curing compound is recommended.

### Limitations:

- Application thickness: Minimum 1/8 inch; Maximum in one lift; Vertical/Horizontal - 2 inches; Overhead - 1.5 inches
- Minimum ambient and surface temperatures 45°F and rising at time of application.
- Do not use solvent-based curing compound.
- As with all cement based materials, avoid contact with aluminum to prevent adverse chemical reaction and possible product failure. Insulate potential areas of contact by coating aluminum bars, rails, posts etc. with an appropriate epoxy such as Sikadur® Hi-Mod 32.
